

AD FS Claims Provider Trust

For the free video please see
<http://itfreetraining.com/federation#provider-trust>

This video looks at the theory of a claim provider trust. In order to have a trust in Federation Services a relying party trust and a claims provider trust need to be created.

Trusts in AD FS

- The configuration used when accepting claims

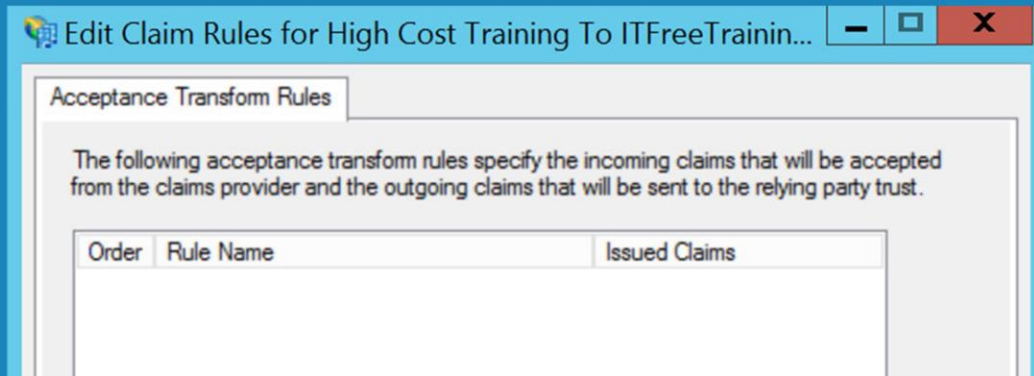

Trusts in AD FS

In the previous video, a relying party trust was created in the ITFreeTraining domain. The configuration in this trust is used to create claims. These claims are sent to the HighCostTraining domain's Active Directory Federation Server. The claims provider trust is the configuration that is created on that server. This configuration determines what happens when a claim is presented to that server. It may seem that the claims provider trust should be on the ITFreeTraining side. However, when you consider that the claim has been created already, the next step is to create a set of rules that determine what to do when the claim arrives at the server. That is, the claims provider trust is, essentially, the configuration that is used when a claim is presented to that server. If you get confused where the claims provider trust needs to be created, work out which servers accept claims and the configuration needs to be created there.

Claims Provider Trust

- One rule only. Acceptance Transform Rule
 - Can change the data in a claim
 - Can change the claim type

Claim Provider Trust

The configuration for the claims provider trust is only one rule. In contrast to the relying party trust which is 3 rules. The rule decides what claims are accepted and also allows changes to the data in that claim to be made.
