Hyper-V Management

For the free video please see
<http://itfreetraining.com/hyperv#/management>

This video from ITFreeTraining will look at how to manage Hyper-V from clients and servers. Set up correctly, the administrator should, in most cases, only ever have to configure the physical Hyper-V server during initial setup and also other configurations can be done from remote.

Demonstration

Demonstration

00:15 Switch to the server running Hyper-V.

00:26 Open Server Manager.

00:34 Go to Tools and Server Manager to open Hyper-V Manager.

00:40 Since the Hyper-V role is installed on this server, it automatically appears in the manager.

00:48 The top center section shows the virtual machines installed on this host .

00:53 The middle section shows the checkpoints.

01:08 A checkpoint is a moment in time of the virtual machine saving hard drive and memory so that it can be restored to that point in time by an administrator.

1:28 Additional details about the currently selected virtual machine appear in the bottom section.

1:40 On the right are settings for configuring the Hyper-V server and the selected virtual machine.

Demonstration Windows 8.1

2:08 RSAT is already installed on the Windows 8.1 machine but does not include Hyper-V management tools. This can be seen when Server manager is opened and there is no Hyper-V Management link.

2:28 Right click on Start Menu and select Control Panel. Select Programs and then select "Turn Windows features on and off".

2:52 In the Features list, expand the Hyper-V item and check Hyper-V Management

Tools. Press o.k. and return to the desktop.

3:12 Open Server Manager and run Hyper-V Manager from the tools menu.

3:28 You can also get to Hyper-V Manager by right clicking on the Start menu and clicking on Search and search "hyper".

3:47 Right click on Hyper-V Manager and click Connect to Server

3:52 Enter in the server name and click Ok. It should connect relatively quickly but sometimes may take a little while to connect.

HVRemote Configuration Script

- Required when Hyper-V server is in workgroup
- Required when Hyper-V server is in different domain
- Hyper-V Remote Management Configuration Utility
 - <http://code.msdn.microsoft.com/Hyper-V-Remote-Management-26d127c6>
- Server run
 - `cscript hvremote.wsf /add:domain\user`
 - `cscript hvremote.wsf /add:user`
- Client (Not required for trusted domains)
 - `cscript hvremote.wsf /anondcom:grant`

HVRemote Configuration Script

04:24 If the server and the client are not in the same domain, for example an untrusted domain or a workgroup, extra configuration needs to be done. Microsoft has provided a script which makes this configuration easy. The script can be downloaded from <http://code.msdn.microsoft.com/Hyper-V-Remote-Management-26d127c6>

On the server to add a domain user run

```
CScript nvremote.wsf /add:Domain\user
```

On the server to add a local user run

```
CScript HVRemote.wsf /add:user
```

On the client, the following command only needs to be run when connecting to an untrusted domain workgroup.

```
CScript HVRemote.wsf /AnonDCom:Grant
```
